OCTOBER 13, 6:00-7:30 PM

2005

MID-TERM EXAMINATION

TIME: 1.5 HOURS

PAGE NO: 1 OF 6

DEPARTMENT & COURSE NO.: 24.426

EXAMINATION: Communication Systems

EXAMINER: P. Yahampath

Closed-book exam: No printed or hand-written material allowed.

A calculator may be used.

Answer all 4 questions.

5 Marks

1. Let $v(t)$ be a voice signal with a bandwidth of 4 kHz.

Consider the modulator shown below. Assume that $f_c = 100$ MHz.

Figure 1:

- (a) If you set the two modulator inputs as $x(t) = v(t)$ and $y(t) = v^2(t)$, what is the bandwidth of the modulator output $z(t)$?
- (b) Let $g(t)$ be the signal obtained by filtering the voice signal $v(t)$ using the filter shown below.

Figure 2:

If you set the two modulator inputs as $x(t) = v(t)$ and $y(t) = g(t)$, what is the bandwidth of the modulator output ?

5.5 Marks

2. A periodic signal $m(t)$ is shown below.

Figure 3:

- (a) Suppose $m(t)$ is used as the message signal in a conventional amplitude modulator. If the modulation index is set to 100%, find the power efficiency of the modulator.
- (b) If $-m(t)$ used as the message, instead of $m(t)$, will the power efficiency be lower or higher ? Explain very briefly, without any new calculations.

Note: The following relation may be useful:

$$\lim_{T \rightarrow \infty} \frac{1}{2T} \int_{-T}^T x(t) \cos(2\pi f_c t) dt \simeq 0$$

when frequencies in $x(t)$ are much smaller compared to f_c .

3. Here is an experiment that a student did with a frequency modulator:

- The output signal of the modulator with the message input grounded (0 V applied) was observed to be $5 \cos(1000 \times 10^3 \pi t)$ V.
- When the signal $4 \cos(20 \times 10^3 \pi t)$ V is applied to the message input, the modulator output was observed to be $5 \cos[1000 \times 10^3 \pi t + 2 \sin(20 \times 10^3 \pi t)]$ V.

Give a reasonably accurate plot of the modulator output frequency spectrum (both magnitude and phase) when the message input is $2.5 \cos(50 \times 10^3 \pi t)$ V.

1 Mark

4. The following signal is applied to the message input of a frequency modulator having a sensitivity of 1 kHz/V.

Figure 4:

The modulator output is then passed through a circuit that has been designed to demodulate phase modulated signals. This circuit has a sensitivity of $\frac{1}{2\pi}$ volts per radian of angle deviation in the input signal.

Plot the output waveform of the demodulator circuit for the interval 0-1 sec.

Useful Formulas

- $s_{DSB}(t) = A_c m(t) \cos 2\pi f_c t$
- $s_{USB}(t) = \frac{A_c}{2} [m(t) \cos 2\pi f_c t - \hat{m}(t) \sin 2\pi f_c t]$ where $\hat{m}(t)$ is the Hilbert transform of $m(t)$
- Tone modulated FM signal ($m(t) = A_m \cos 2\pi f_m t$)

$$s_{FM}(t) = A_c \sum_{n=-\infty}^{\infty} J_n(\beta) \cos[2\pi(f_c + n f_m)t]$$

where β is the maximum angle deviation (modulation index) of the carrier.

- Fourier series of a periodic unipolar square wave

$$s(t) = \frac{1}{2} + \frac{2}{\pi} \left(\cos 2\pi f_0 t - \frac{1}{3} \cos 2\pi 3f_0 t + \frac{1}{5} \cos 2\pi 5f_0 t - \frac{1}{7} \cos 2\pi 7f_0 t + \dots \right)$$

- Trigonometric relations

TABLE A6.8 *Trigonometric identities*

$$\exp(\pm j\theta) = \cos \theta \pm j \sin \theta$$

$$\cos \theta = \frac{1}{2} [\exp(j\theta) + \exp(-j\theta)]$$

$$\sin \theta = \frac{1}{2j} [\exp(j\theta) - \exp(-j\theta)]$$

$$\sin^2 \theta + \cos^2 \theta = 1$$

$$\cos^2 \theta - \sin^2 \theta = \cos(2\theta)$$

$$\cos^2 \theta = \frac{1}{2} [1 + \cos(2\theta)]$$

$$\sin^2 \theta = \frac{1}{2} [1 - \cos(2\theta)]$$

$$2 \sin \theta \cos \theta = \sin(2\theta)$$

$$\sin(\alpha \pm \beta) = \sin \alpha \cos \beta \pm \cos \alpha \sin \beta$$

$$\cos(\alpha \pm \beta) = \cos \alpha \cos \beta \mp \sin \alpha \sin \beta$$

$$\tan(\alpha \pm \beta) = \frac{\tan \alpha \pm \tan \beta}{1 \mp \tan \alpha \tan \beta}$$

$$\sin \alpha \sin \beta = \frac{1}{2} [\cos(\alpha - \beta) - \cos(\alpha + \beta)]$$

$$\cos \alpha \cos \beta = \frac{1}{2} [\cos(\alpha - \beta) + \cos(\alpha + \beta)]$$

$$\sin \alpha \cos \beta = \frac{1}{2} [\sin(\alpha - \beta) + \sin(\alpha + \beta)]$$
